

Use Case 2

Treasury Loan Diligence Automation · Return on investment · October 2026

About 2,900 staff hours a year back: each document is expected to go from 206 minutes of staff time to 61.

\$159k net value per year at 100 documents a month	206 → 61 min expected staff time per document, after Use Case 1	2,900 h staff hours freed per year, about 1.6 full-time positions	\$456k cumulative net value over two years
---	---	---	---

Staff time per document

Figure 1. Use Case 2 removes about 145 minutes from each document, 70% of the time left once Use Case 1 is running.

Use Case 2 automates the rest of the work around the wire instructions: collecting the request and its attachments, checking the settlement statement against the email and the wire, listing exceptions, and preparing the triage workbook, CashPro file and BCMP values. It builds on Use Case 1, which already reads the wire instructions. It is not built yet, so these figures are estimates to be confirmed in the pilot.

Annual value

Staff hours freed per year	2,900
Full-time equivalents	1.6
Value of staff time at \$55/hour	\$159,500
Running cost (AI processing and hosting)	\$600
Net value per year	\$158,900

Cumulative net value of Use Case 2 over two years

Figure 2. Volume starts at about 100 documents a month and grows 3% a month. With no growth the two-year figure is about \$318k. Build cost is not included.

Where the time comes from

Minutes per document, by task

Figure 3. The largest reduction is in cross-document checks. Exceptions keep the most manual time, because call-backs to verify masked or changed wire details stay with a person.

What Use Case 2 adds

- Automatic checks between the internal settlement statement, the request email and the wire instructions: amounts, fees, fund, dates, routing number format and masked accounts.
- The triage workbook, the BOA CashPro import file and the BCMP values, ready for review.
- A list of exceptions for Accounting, each with the reason it was raised.
- Request emails and attachments collected into a standard SharePoint folder for each loan.

Accounting keeps the controls it has today: review of the source documents and outputs, resolution of flagged values, CashPro and ProMerit entry, second-person approval and final release. The system prepares payments. It does not send them.

The build cost is not set yet. The table shows how much Use Case 2 could cost to build and still pay for itself from its net value.

To pay for itself within	6 months	12 months	24 months
The build can cost up to	\$79k	\$159k	\$318k

The saving depends mainly on volume and on how much review work is left once each step is automated. Net value per year:

Documents	Half the estimated review work	As estimated	50% more review work
50 a month	\$94k	\$79k	\$64k
100 a month	\$189k	\$159k	\$129k
200 a month	\$379k	\$318k	\$258k

Running cost

AI reading of the settlement statement and email, per document	\$0.0134
AI processing per year at 100 documents a month	about \$16
Additional hosting: mailbox and SharePoint automation, storage	about \$600 a year

Priced at the same Azure rates as Use Case 1, assuming about 4 pages per document for the settlement statement and email. Use Case 2 runs on the Azure services Use Case 1 already pays for, so only the additional hosting is counted here.

Basis of the figures

- **Provided by the business:** about four hours of staff time per document today, and about 100 loans a month (from the Treasury loan volume).
- **Estimated:** how the four hours divide across tasks; the share of each task that remains with a person once it is automated (intake 10%, cross-document checks 25%, exceptions 60%, output files 15%); a loaded staff cost of \$55 an hour; 3% monthly growth; AI pages per document and hosting cost.
- **Not yet tested:** the cross-document checks and exception rules. Their accuracy, and the time they save, will be measured in the pilot alongside the current process.
- **Not included:** the cost of building Use Case 2, and the avoided cost of a misdirected wire. Staff hours freed are capacity for other work, not a budget reduction unless roles change.
